

More Alien ETs

16 September 2017

In anticipation of the upcoming release of The Alien Handbook.

First I ask The Committee:

Q: Is this picture accurate?

C: Yes, especially for the human in the center however the male in the blue suit is a minority among you, the Earth inhabitants. You all know there are great variations among Earth dwellers and between the genders, which occurs in at least as great a variety or often more, among the inhabitants of other planets in your galaxy.

Q: Not the universe also? Such as in other galaxies?

C: Of course, but the galaxy you occupy is sufficiently large to provide great variety of fascination to humans and all biped inhabitants of Earth. There are many common characteristics among inhabitants of very diverse worlds with little or no contact between them. What humans call a tall white or tall grey can represent civilizations with no relationship between them, or there can also be significant relationships.

Q: How many civilizations resemble humans?

C: Few, and the resemblance you would consider similar enough to qualify would not be a close resemblance in human terms. There are physiological differences not apparent on the surface of a biped with similar proportions of cranium and brain size, leg and arm length, organ size and orientation or even inclusion or absence of them.

Q: You have told us, as have aliens themselves, that physical interaction is sometimes difficult because of vibrational differences.

C: Yes, and these are an effect of not only the incongruous frequencies but intensity. Five humans in the physical proximity of an incongruent visitor from another planet will feel less effect than one human. Remember, you are an alien species yourselves and you are strange, even weird to many beings.

Your appearance and actions, bodily movements and use of speech, sight and hearing can cause the effect you would feel if observing a horse talk or a dog sing.

Q: How have some alien ET visitors overcome this problem when meeting with humans?

C: They employ vibration cancellation devices to counteract the effect of human energy waves, and sometimes to counteract the effect of their own upon humans, often both.

Q: Does this affect humans in any way?

C: No, however it can interfere with the alien ET telepathic ability to an extent, and reduces the range across which the alien ETs can read human thoughts. This seems to be of little to zero consequence to humans, because human hearing ability is still less than the reduced range of alien ET thought interpretation. For this reason alien ETs prefer to be in relatively close proximity to humans, to ensure their ability to read human thoughts well.

Q: We, that is, the very few humans who have communicated face-to-face with alien ETs, do not need to speak?

C: Not at all, however you all have and will do this for some time, because of the human perception that thoughts not spoken aloud means communication is not accomplished. The alien ETs patiently wait for human speech to be carried out after the thoughts which lead to the speech are generated. This is important because human thoughts believed by humans to lead to effective communication are distinct from human thoughts not intended spoken. In simpler terms, you do not express your all your thoughts in words, and often differently. The examination of what is said versus thought adds nuance and meaning.

Q: When I ask an ET to channel with me, in effect conducting telepathy, is there a frequency dissonance problem?

C: None, because of the distance. You are linked with visitors in orbit above Earth at distances of tens of thousands of kilometers; this eliminates the incongruence and effects.

Q: So the vibrational differences are mainly because of physical anatomy?

C: Not mainly but include it as an essential component. Your body's operation includes the use of the brain, these are indistinguishable and permanently connected. By achieving sufficient physical distance to lower the interaction, the effects fade to the point they seem to disappear. Five drops of an alcoholic beverage will produce no perceived effect when ingested, yet five glasses of four ounces each of the same liquid will have a notable effect. You can smell the effect of the evaporating liquid in quantities of just a few drops when near or in the nose & mouth, even better than you might from a bowl of the same liquid two meters from your nose.

Q: OK, let's go to the ETs and ask them to inform us about when they will come.

C: They have, already.

Q: This leads to the first question! In what way will alien ETs reveal their presence in an unmistakable way humans cannot rationally deny; in other words, providing evidence to human senses that cannot be refuted. Can you ask a nearby alien ET visitor to please come address this?

C: Indeed, allow us a few moments of your time on Earth to arrange this.

[A few minutes go by in Earth time, which I pass by looking at on-line car magazines, specifically a review of the new Kia Stinger - which won't ever grace my driveway or even backside, nice as it seems.]

AE: Thank you we do, how can we help?

Q: The questioner is the respondent, tables turned.

AE: In conversation, who is the interviewer or interviewee? Neither. Ask what you like.

Q: *We humans require labels and attach them, even of our own making, if we don't get one we can comprehend. Who are you all, where are you, from where do you come?*

AE: Curiously we notice this, because we do the same. Classification and organization require it. We are from a set of planets in your and our quadrant of the galaxy. We are located closer to the center and our observance of Earth forms part of our exploration away from the center. We have done a large amount of exploration of the central core and now reach out towards the edge, beginning with our and your quadrant. We are orbiting Earth by hovering, in what you would call a synchronous orbit but we are not using your Earth's gravity to achieve this, although we could. We are above what you call your southern Indian Ocean. We have no name you would understand.

Q: *How many of you as individuals are aboard your ship or vessel?*

AE: We are, as you would say, three dozen in number. We are not representative of our people but in the physical, just as human space travelers are not representative of many Earth inhabitants, not even closely.

Q: *Do you specifically have plans to contact Earth and reveal yourselves to us?*

AE: Most certainly not. We would happily do so but there are already plans in place for your closer neighbors to do this, who will. We would add nothing to the process but our own enjoyment, and likely cause confusion and difficulties. We ask you to consider a wedding ceremony or a funeral. If you are not invited, what do you add to the proceedings? Unlike ourselves, as humans you may attend if you remain quiet, display the appropriate appearance expected of all in attendance and participation and cause no disturbance. We would do this, simply by the reaction of our peers, our colleagues your fellow space traveler visitors.

Unlike such human social ceremonies or events, we can observe and extract as much information as we believe useful, without revelation of our physical selves.

Q: *What humans wish to know is WHEN are we going to see such galaxy visitors walk on our planet's surface and communicate with us?*

AE: In a way the large majority will accept and believe; this has already happened and has many, many times over the course of human existence on Earth. In fact it has happened many times before humans were created and allowed to propagate.

Q: *Allowed to propagate? As if we were going to be stopped?*

AE: No, but this was possible. By leaving humans alone, this process developed. There was no pattern of leaving Earth alone; it would barely resemble itself if plant then animal life had not been seeded on Earth by visitors such as ourselves.

Q: *Such as "ourselves"? Did your civilization have a hand in the placement of animal or plant life on Earth?*

AE: No, however many did. Mostly from your star cluster, however as you know from the other information this book supplies, the humans you are were created by a civilization far from your star cluster, which has not returned but to observe.

Q: *I do not need to mention how fearful and also misinformed to the point of tragic misguidance, many of us are with the idea alien extraterrestrials would come to Earth.*

AE: But you have here made this mention.

Q: *Why don't I personally feel any worry or concern, or even much interest?*

AE: Into what many of your peers call your higher self we will look, this is the aspect of your being you cannot well recognize when you are awake. You personally know this exists yet accept it is not a higher part of what has a lesser counterpart - you are not less than yourself in any way or form - and it is where your life plan or schedule, your budget of experience, resides. It holds forth this role for you personally, to establish the contact we now make together, and to help distribute our thoughts across

humanity. When we say "our" we are most certainly not limiting this definition to our civilization, but rather we include all sovereign civilizations with plans to visit Earth and the few among them, to expose their presence on a large scale.

Q: Are we going to see several different civilizations simultaneously?

AE: No, there is a schedule and plan for each, to present themselves in order. Each will introduce the subsequent one, the greatest challenge will be the first.

Q: How fast will this occur?

AE: The pace of the roll out, as humans like to say, will depend almost entirely on humans. Your collective reaction. This cannot be controlled, and there is no desire to do so. Much human effort is made to predict economic activity and the ability to prosper in material, physical ways. Do economic forecasts turn out as well or as accurately as they suggest? The greater the audience, the less likely. The bigger the audience means the greater the collective belief and there will always be a segment or sector of the believers who will alter their behavior to either avoid what they deem loss or secure greater proportional gain for themselves. These efforts alter the course of activity and change the outcome. The forecast is then deemed inaccurate.

The challenge with forecasts involving human behavior is the assumption of reaction and the inability to establish a tipping or turning point created by collective changes to behavior. Much as chemistry successfully determines change points in titration, this cannot be done with human free will.

Thus human reaction to the widespread information that visitors such as ourselves indeed exist and can fly through your atmosphere, land upon your planet's surface and communicate with humans, will determine to the second group when and how they shall do the same.

How will you react to your aunt telling you at your age of twenty she is really your biological mother? How will your aunt, who you have always believed to be your mother, then present herself as no longer your mother? Will this information delivered by both women simultaneously become too much manage or will you be indifferent to it? This is your choice. Will you reject them both as being dishonest to you during your entire life? Will you more easily accept this news first from your aunt you now know to be your biological mother, with nobody else present or aware? If you choose to accept it, will that make things easier for your aunt now known to be your mother, to come forward and speak with you in the newly revealed role? How fast or slow should this be done?

Your alien extraterrestrial cousins are very aware of this, and will not appear in a way likely to set off fears of an invasion. Panic will overwhelm many of you if critical mass is reached. No purpose is served by this.

Q: Since the pace is determined by our reactions, when then will the first revelation take place?

AE: It already has, the difference will be frequency and nature of them. Humans have taken keen notice of crop circles, designs and drawings but trip all over one another with absurd explanations which do not measure up to basic common sense much less scientific examination. The default tendency as alien ETs are involved, is to reject it and label any human as mentally unfit to some degree.

We take the current president of the nation the US of A as an example for comparison. How many observers reject him in just this way and moreover how many of such detractors rush to label, demean, criticize and worse, in very small numbers, even physically attack anyone not in agreement with their ideas? Yet the president is the president, chosen under an irrefutable system used dozens of times.

With great interest we observe the choosing of a leader in public policy and its execution, who had no prior, direct experience in the process. This was the appeal to supporters, who have by choosing such person for leadership, expressed their dissatisfaction with the choices made over several previous elective cycles. The actions and reactions are most informative to watch. We suggest observance of athletic competitions, what are called sports, as being similar. For us above all, the observance of human behavior is like watching sports.

We return to your question, these comparisons now drawn; the first revelation carried out in such way to seem like a first contact - which it will absolutely not be - will occur at some point human reaction to geophysical events reaches a critical phase.

We refer specifically storms, earthquakes, volcanic eruptions and changes to Earth's magnetic grid. These events will come in clumps, or groups or series. Reactions to them will be as you can surmise, however the upswing of a new round of events after a calm period seen as the end of a round of bad events will spark fear and panic. Even humans aware of these changes, such you who now read these words, will be affected if by nothing more than watching the reactions, often of desperation, from others unaware of the process.

Alien ET contact will come at what is deemed the crucial thus ideal moment, shortly after a renewed series of events is feared. This will be done to provide explanations and reassurance, and even as some will desperately ask the first alien ET contactor to stop or control the geophysical events, these first contactors will explain how they are no more able to halt what happens than you humans are.

We shall remain in orbit and observe.

Q: I don't believe my GAGs would address this in a similar way, so allow me to ask a little about recent and ongoing current events on Earth, as I assume you have been observing.

AE: Yes, we have and please do ask.

Q: Kim Jung Un of North Korea. Your take?

AE: He strikes us as a misguided and immature adolescent who has discovered his father's weapons after his father's death.

Q: The family, maturation and societal issues humans have also occur in your civilization?

AE: Of course, and or but, in different ways. The development of scientific understanding and technology of use and benefit to dense body being such as yourselves and ourselves, occurs as more beneficial interactions develop. The decision of the few to employ violence is one example, the understanding and use of money or media of wealth exchange are another.

Nevertheless, there are similar patterns and challenges. Much of what we observe and have seen on Earth displays interesting similarities or alternatives, to challenges which took place on our worlds, long before current technology developed.

Q: What challenges do you have now? For example, climate change global warming humans effect, and alleged damage we cause, is a big topic. Who are the "hoaxers" and "deniers" on your world over what issue, currently in play?

AE: We face a challenge regarding education of our offspring or children as it involves other civilizations with whom we have contact. Think of sending German schoolchildren to Africa for a significant part of their youth and education; the quality of the education is called into question by the parents of some students sent, because they prefer their children learn about, but avoid assimilation of, characteristics of other worlds. They do not like the idea their Nigerian children speak German and enjoy sausage and sauerkraut, to give an Earth comparison example.

Other ideas say this is essential, because there will always be interaction between the planets, as there is significant trade and commerce.

Q: Do any of your 3 dozen crewmembers have children in such interplanetary shared education and what do you or they think of it?

AE: Yes, some do. Because these children live for several segments of their youth on other planets, they are essentially adopted and become the offspring of their hosts, who are no longer but become guardians and family. This leads to adoption and observance of social customs of both civilizations.

There is no physical compatibility for reproduction. For Earth comparison we would suggest chimpanzees and orangutan with equivalent general intelligence, one observing a religion you might call Islam, the other group a faith such as Buddhism on Earth.

Some of the Buddhist Orangutan resist their children becoming socially integrated to the point they become Muslim Chimpanzees also. Just as different human groups see close neighbors as devils. Palestinians and Israelis are a weak, Earth example.

Q: What about money, wealth and acquisition of buying power?

AE: These operate along a transparent system where creation of money is transparent to all who observe, and serves as a reference, not a definition of wealth amounts. On Earth few of you have control over monetary authorities' printing and creation of currency, the creation of exchange media. Such amounts increase automatically by virtue of use anyway, as has long been established in Earth economic study. In our society, computer technology allows us to provide a constant, available to everyone figure of the total currency amounts in existence. There is no risk of currency value collapse, because of this and also because much commerce takes place through direct barter, and no reference to money is made in the transaction. Humans have evolved away from barter and long term consideration of value, independent of money. This will return in a big way on Earth, and often abruptly, and there will be social convulsion among many of you who have attached their notions of self worth and esteem to bank account balances and investment values.

This is one area where alien ET visitors will offer advice directly to Earth populations independent of governing bodies the same humans have chosen to erect. The natural, immediate consequence will be for the members of the governments to reject what they see as competition and criticism of their existence and performance. The alien ET reaction will be to say, choice is the solution to challenges which exist with government agencies. These organizations behave monopolistically on Earth, and exist so as part of the notion of the sovereign nation.

When enough citizen inhabitants of the sovereign nation try out the new methods and experience better outcomes, a fundamental shift in public policy and governing will have begun on Earth. Alien ETs will never impose or control, they will simply explain options and possibilities.

Humans attempt to control bad behavior by control of inanimate objects. Transportation devices are taken from drug impaired users and in some cases, a few have freedom temporarily taken, what you call prison. Other attempts are made to keep weapons away from what are called criminals but curiously these efforts affect mostly the ability of potential victims to effectively protect themselves.

The solutions to these challenges will be found in methods which greatly reduce the tendency of certain behaviors, not restriction of inanimate objects. There will be acceptance and implementation, vigorous rejection and indifference to these ideas, when supplied by alien ETs.

Q: How long is your physical life?

AE: We typically live four times the expected length of life of humans, which to us seems as if it were twice the length. Our planets revolve at about twice the relative speed as Earth, and we consider the length of a day to be almost the same as you do on Earth. What we might call two hundred years are the equivalent of one hundred on Earth.

Q: What brings about death?

AE: The organs of the body wear out. Their function diminishes, often slowly.

Q: Disease and injury?

AE: We have eradicated fatal disease and almost all sickness. Injuries occur but rarely and almost never fatally.

Q: Do you have Guardian Angel Guides as we do?

AE: Yes, and some humans have life experiences as members of our civilizations. Not remembered, by design.

Q: Do you spend long periods near Earth?

AE: No, we come and go as we choose, often staying for no more than a day or two of your time. We reach Earth or return home in just a few hours of your time. Two days watching Earth is a day trip for us. As you might say, breakfast at home, dinner at home, lunch on the job.

Q: Do you ingest food as we do?

AE: No, we consume a liquid diet, which contains all necessary nutrients.

Q: Isn't that boring?

AE: Not in the least; our diets are at least as varied and entertaining to consume as your Earth cuisines. We do not chew and have no teeth but we enjoy sustenance even more than do humans. Mealtimes are great social events. Human resistance to speaking with a full mouth does not happen; we simply take in food while listening to thoughts.

Q: Do you have individual names or one for your civilization or culture?

AE: No. Just as your animals do not name one another yet have zero difficulty identifying one another or their group.

Q: Maybe the animals are more advanced?

AE: No, such nomenclature is simply an effect, a habit of spoken language use. Use of names as humans use automatically is not an indicator or advancement or otherwise.

Q: My deep thanks for your time, words and thoughts.

AE: Your sentiment is appreciated and valued but rejected. It is our role to grant thanks to you. We wish you well always, individually and collectively. The enjoyment and entertainment we derive from observance of Earth cannot be described with Earth human language words, and we are thrilled with the chance to have expressed thoughts through a human for others to also have. This exchange will be widely popular on our worlds. Fare you all well, we wish.
