

# Nukes, Spooks & Flukes

20 March 2017

A reader asks:

*I've some questions about our extraterrestrial cousins (again!) but this time is more related on their future intervention in our terrestrial affairs.*

C: Your extraterrestrial alien cousin visitors to Earth will never intervene in your affairs. Intervene means to change decisions, outcomes and effects that would not come to be, as and if the result of individual or collective human decisions.

*I've read somewhere in your books that, for the most part, our cousins will avoid intervention of any sort in our problems (except maybe exchange of philosophical knowledge and informations on the state of affairs outside our solar system).*

C: This is correct, the provision of information is not intervention. The decision to apply & use, save or discard the information remains with the recipient. It is provided when the decision to apply the knowledge will be of greater benefit than harm. This determination is made by the consciousness of Earth inhabitants and their Guardian Angel Guides, in the collective, through a function not different than a board of representatives or a panel of designates. Each soul upon Earth may contribute - vote you call it on Earth - in the decision. This is often done through a Guardian Angel of the human soul, a proxy vote if you will, and the decision can be made during sleeping hours in conference with a soul's guides. As the human soul's decision was either decided or scheduled for this when the life plan & course of the human was set forth.

*They will stay outside our problems, except for a very specific one: the disposal of our radioactive wastes that plague some sites around the world, like Fukushima and Chernobil. In your books, you even gave some specific details of the methodology adopted (stopping the sub-subatomic structure and rendering all the material a highly freezed, non-radioactive, new kind of material).*

C: Alien extraterrestrials will not distort development of what you believe to be a problem, however will remain in close observance and proximity, and not distant enough to be outside them, as you suggest.

There will be no alien ET involvement in the disposal of radioactive material humans create. The one action which would be halted is detonation of a nuclear warhead, however this would not be accomplished by alien ETs, but rather by us, as a collective. The GAGs of Earth and its human population would intervene to halt detonation.

Your alien ET cousin visitors would never detonate a nuclear weapon, yours or theirs, if they possessed them.

*I'm just interested, between other things, in studyng the energetic issues that are critical today, like the disposal of radioactive spent fuel from nuclear plants. This is becoming a big issue to*

*tackle, considering that a lot of nuclear plants are running on near or beyond their scheduled running time.*

C: Yes. Solutions abound among humans. Costs are the obstacle.

*DO our cousins really will come and intervene in this issue also? Or do they limit their intervention to only the nuclear incident sites? Or maybe they have changed idea and they do not intervene at all?*

C: No, no and no. As we explained above.

*Considering Fukushima, I know that the radioactive leakage (water that is continuolsy immitted into the ponds) is going unchecked into the sea from the first day (that is, 6 years ago) and probailly will continue another three decades.*

C: Or longer; it is unlikely to be completely halted within thirty Earth years of time, however there could emerge a method to make this process un-suicidal. The new process would protect humans approaching the site from radiation effects or death. The decision if and when to introduce this process and associated technology has not been made. The option exists and has been set down along the lifeplans of many involved, for consideration.

*Do our cousins are monitoring this? How deep is the problem for lifeforms in the region (considering also humans)?  
Do they are planning their intervention anywhere soon?*

C: Yes, all Earth events of even small scale are observed.

The problem is, as humans well know with nuclear fallout, proximity and concentration. Physical dry surface distance provides safety and the dispersal of radio isotopes in the seawater likewise dilutes the concentrations thus risk to safe levels over sufficient distance.

To your last question, no.

*Or are they just waiting that Japan government breaks under the strain of economical crisis, first, and be forced to officilly ask for outside help no matter from where it comes?*

C: No. This assistance would not be given by alien ETs, even if requested. This is not a means by which disclosure of alien extraterrestrial presence shall be made; the effect across Earth would be far worse than contamination, injury and deaths which are and will result from this disaster.
