

Time Travel

22 March 2017

Reader question:

I just saw a real-time chat with someone claiming to be a time traveller from the future. He said in 2030 remnants of the EU will be in existence but it went through a massive financial overhaul...possibly still hanging by a thread...in his timeline. I know timelines can change so his version of the future could exist as a reality (personally, I think EU will be pretty toothless, if it at all exists by then), I'm interested in knowing if he was an actual time traveller. Said he was a test subject. Will there be time travel testing around 2030/35?

The Committee: The reference to thread hanging refers to a run-off of obligations between nations of the former organization. To the question as to if this was a time traveler, we say yes and no.

Yes, because the information came from a being with ability to see and experience time sequential events as if a part, component or member but not attached to the time period along the sequential line humans see & experience.

No, because there is no time and no need to travel to and through it, the word travel itself implies time.

The better way to view this is to perceive time events as alternatives among which you can shift perspective. Imagine an electronic book, with a display of pages where each tells the story of an event or an occurrence. Unlike a book with words or characters of a human language, this book will also display images and views of the occurrences. These can be overall pictures of what occurs, as would be seen through the impartial lens of a camera, or they can be through the eyes on any participant. The information can be expanded much as is done now with websites on the human network of information. Buttons open new and ever expanding support information, in schedules, backing sheets, support pages and so forth.

The reader of the book must examine the story or imagery sequentially, through the eye of observer or participant. The amount of detail can be expanded as much as desired, or also compressed into succinct summaries of events.

The daylight to nighttime cyclicity of Earth existence creates segments, each of which can correspond to a living page of such book.

The reader of such a book can also participate to a degree, and what you have described as a time traveler is a being able to describe what is seen in the pages of such book.

There can be - and are - other books with other stories, many which can align with related volumes, tomes and manuals. Books related to common places and calendar sequences. The "time traveler" is but reading from a book.

Which book is correct? All of them; the better question is, which book is chosen to be read - or written?

As has been explained by us several times, and we repeat again, for the relevance the explanation holds to this example, humans perceive time in the form of a line.

Human memories form a string of events which lead back to a prior period, just as does a number line "below" zero. Besides such line leading back, it is known that in one month, it will become possible to stop and look back upon the current moment and see such line extended "by one month". Because there is always a line leading backwards from the point a human finds her- or himself - the string of memories - it is logical to project another line forward. You know that at some and any point in "the future" it will be easy to see back along this ever lengthening line.

There is more occurring. Your choices represent many lines. We suggest a large, mature tree with many branches, as wide as it is tall. Standing at its base, it is easy to see the thick trunk as infancy and early childhood. Where branches begin as the thick trunk reduces, and spread of the tree begins, represents a human life. Many, many paths are available. Farther along each path makes a switch to another less easy, yet always possible. Simple retracing and resetting of one's destination will lead to a place elsewhere on the tree, around its other side and at a higher or lower upon the great crown.

Copy this tree and attach a mirror image of itself to the bottom, so a massive crown grows upon both ends of a singular trunk. Where the bark now begins at the surface of the ground, starts the spread of the opposite, equally prolific crown. This tree cannot exist where gravity and a dense environment of soil, air & water surround it. Thus no ability to travel from crown to crown is likewise possible. This dual tree exists - in the reality of your mind. That you have imagined it with the words you have just read, creates it. It exists as solidly and sturdily as it does in front of you in half form, with only one crown, because your thoughts have re-created it from the thoughts we used and transmitted to you to make it real.

Remove physical dimension constraints make this tree is easy to create and follow. The absence of constraints make jumping - from one thin, far from the trunk branch to another of a similar size but on the other side - simple.

This is a view of what it called time travel. This is what was shown and discussed, as the basis of the observation and the question posed by the reader.

Time travel testing by humans? Not in the physical bodies now required for human, however time viewing will become more well known. This has already been done by humans on Earth, and will only increase. The disclosure of the process will come & increase as humans come along also, with beliefs and acceptance. This is not a rapid process, against the human perception of time's passage.

Do return as we do; be well, one and all.
