

Q&A

9 April 2020

Fourteen questions below, presented as an Adobe Acrobat file (*.pdf) to make the website less cluttered but mostly for readers to save posts. I've done this for a few moons (*such as last night's full one, it was lunacy*) for this purpose.

Brief reminders regarding questions:

- I'm not a critic, pundit or analyst of articles, essays, new reports and videos. For questions about one, describe the video, essay, article or news in one or a few sentences, then set out questions concisely. There is no need to send a link to the written item or video, I won't watch or read it with a view to addressing questions about it.
- "*Please comment*", "*Can you opine*", "*What are your thoughts*" and "*What do you think about...*" are not effective questions. To release information wanted, formulate precise questions. I am a Texas yahoo; my viewpoints, opinions, remarks and comments are not worth hearing.
- To find out what's true, fake, a hoax or "real"...the gut knows. Listen to your Guardian Angel Guides. I am a substandard —if not downright deficient— truth meter.

RQx = reader question (*that hardly needed an explanation, but some redundance on a cloudy night ain't so bad*)

A: My answer

C: The Committee's answer

RQ1: *Thank you, I always feel safer after visiting this site.*

- *How will loans, mortgages and credit will be affected. I understand that if no one can pay a mortgage, there is no-one to buy a home. How then, will property change hands?*
- *Should I be moving to areas closer to town and farmer markets? Up a mountain makes a bicycle tough.*
- *Will people too far from needs or family be able to move closer?*
- *Hydroponics seems great to grow food during the dim period but if electricity becomes too expensive, a hydroponic garden isn't a good plan.*
- *Will solar panels be a better source of power?*

C: Lending and borrowing will initially follow economic changes with the expectation and hopes to return to things they way they used to be. As economic conditions are understood to be changed permanently, lending and borrowing will adapt also. Overall less will exist. Mortgages for the purchase of homes will rely more than it has ever, upon the successful purchase of insurance to protect a lender's risk. Much less borrowing will occur, both because of less consumer desire to borrow and less desire for investors to enter, renew or expand lending.

If you can safely walk the distance at intervals required to bring provisions, remain long term. Fuel will be available however extremely expensive. Shorter trips will reduce the transportation cost as a percentage of the food cost for the trip. Do not invest in a vehicle unless you plan to

keep it for a decade, it is likely, depending on a vehicle loan you might choose, to have the lender disappear before receiving payment in full.

Moving residence will be possible physically, if slower and more expensive. The idea a house can be sold is the challenge.

Hydroponics are good if no yard, garden or land is available.

The ability to make electricity will not be the problem it is the price. Solar panel and battery packs are costly; required capacity, battery replacement cost and intervals plus installation expense will require analysis.

RQ2: With the change in trees, will pollen production also?

C: Pollen production will drop with dormancy of trees.

RQ3: About the 5G rollout:

- *It is assumed developers are unaware of harmful effects (assuming any) or just dismissive at best?*
- *Do the frequencies have adverse effects on health?*
- *Do studies show or hide effects for the economic benefits?*
- *Being linked to coronavirus by David Icke, does a physical reaction to 5G signals which compromises immune systems and lets the virus take hold more prominently?*
- *Assuming sickness from only 5G, would it be far more prevalent with the coronavirus?*
- *Are nefarious intentions for 5G the motivation or profit? Faster thus more expensive and lucrative service?*

C: No, to all questions and nearly nil harmful effects come from the radio signals of what humans have called "five gee". Electromagnetic transmissions of the intensity involved, are not harmful; the magnetic fields created by devices and components can be risky, for frequent and extended exposure, near the skull. The motivation is profit, quite nefarious for some among you all.

RQ4: Sir Linus Pauling suggested megadosing Vitamin C could reverse cancer and heart disease. Was he right?

C: Yes, in many patients this is effective.

RQ5: For navigation and travel, TC talks about aircraft abandoned and slow ocean ships.

- *Are replacement means coming, based on new technologies such as free energy (Tesla's work) with help from our ET cousins?*
- *Are zero pollution & navigation problems, thanks to advanced systems, nil petrol and fast ...will this come to be?*
- *In a very distant future will humans develop "astral travel" and telepathic abilities to visit across the world, meet far away friends that way? If so, definitely we enter a new human era; today's aircraft and ships would indeed look like the Middle Ages!!*

C: There is no free energy; it is lower cost because of zero fuel. Transmission and distribution will always incur expense. Some but very little ET visitor assistance will be offered, little will be necessary.

Eventually zero pollution, rapid travel and perfect navigation will come, however not in your lifetime. Humans have these talents and abilities now; most often used when asleep, remembered sometimes in bits & pieces as dreams. Gradually and slowly dreams will contain less of this, as it slowly and steadily re-develops from humans' innate talent.

RQ6: When will money or the need to work disappear? Will it valuable to return to nature soon? When will we learn that we can connect with all beings and are not separated from them?

C: Never, always and now.

RQ7:

1. *If poles shift hundreds of kilometers in a hour, and planes veer off course, will there be air crashes, e.g. after fuel is exhausted?*

C: A very few however pilots will recognize course deviations as some point, land safely when possible and adjustments to flights will be attempted.

2. *There are substitutes to GPS like "Inertial navigation". Couldn't these be used when GPS becomes unusable?*

C: Yes, however malfunctioning GPS and compasses, together will spook many a pilot.

3. *When balloons replace planes, what kind of navigation will they use to reach the destination?*

C: Ground radio beacons; the balloons will be stationary or move along longitudes as Earth rotates below.

4. *Will the reduction in male fertility be connected with earth's magnetic disturbances?*

C: Yes, somewhat however not solely magnetism will cause the effect.

5. *When will the earth's magnetic field stabilize?*

C: Slowly over a several year period beginning in about a decade, improving before then.

6. *Where will be the final location of the Magnetic North Pole and South Pole after it stabilizes?*

C: At almost the same place & spot they have been since discovery.

7. *Will the "new electricity" be used only after the magnetic fields stabilize?*

C: No, it can be developed and used now, then and anytime in-between.

8. *Will there be any enormous solar flare knocking out our electrical grids, satellite communications etc.?*

C: Yes, with effects similar to a minor electromagnetic pulse.

9. *Will the satellites remain unaffected and in their proper orbits at the end of the Shift?*

C: Human satellites orbiting Earth will experience and suffer a broad range of effects, mostly negative and considered malfunctions. The orbit trajectories themselves will not be significantly changed.

Continued...

10. *Scientists have detected that the Supermassive Black Hole at the centre of our Galaxy Is becoming more active (<https://www.sciencealert.com/the-supermassive-black-hole-at-our-galaxy-s-centre-is-growing-more-active>) Why? Is there any effect of its increased activity on Earth?*

C: The energy of this shift is passing through the entire galaxy, causing the current and soon-to-be felt effects on Earth and also the entire galaxy.

RQ8: I've been watching a show called Skinwalker Ranch. Its located in Utah. There has been animal mutations, UFO sightings and energy disruptions. What's going on there?

C: Your question is answered by its preceding description.

RQ9: Do spirits in Heaven experience physical sensations in Heaven? For instance, Erik Medhus said they can go to a beach there. Would they feel water?

C: Yes, however the sensations are not the same. Souls in Heaven do not alternate between human physical experience and what is sensed in Heaven, always making comparisons. This is a human focus.

RQ10: The dim period will have reduced sunlight affecting plants, will it affect humans making vitamin D? I don't get enough sunlight now; do vitamin D3 supplements work, especially if needed during the dim period? Do tanning beds offer the same benefit as the sun to make vitamin D?

C: Increasing outdoor exposure by the time needed to compensate for the reduced sunlight will be easily achieved. Yes, the supplements are a mediocre solution. Exposure to the sun is vital; you hurt yourself by not getting it. Tanning beds are also a mediocre substitute; the benefits of sun exposure are not just physical, something no pill or artificial tanning device can replace.

RQ11: Overseas travel gone, will intra-national travel be possible? What would be the average mileage that would be achievable? For instance, would someone from Georgia be able to travel to Florida? Would someone from Southern California be able to travel to Northern California? I would think that if shorter distances are achievable, tourist towns might survive if not thrive as before.

C: Yes, but much more expensive and less frequent scheduled trips. Mileage or kilometrage assume motor vehicles; the same distances will be possible as now, but at far higher expense. Yes, these trips will be possible if not feasible for the majority. Tourism will plummet for a time.

RQ12: How soon will the navigation issues and polar changes start happening?

C: You mean, become noticeable. They are already happening. When ash clouds become visible and are immediately understood as being caused by the impossible-not-to-notice eruptions and ash preceding them. Year 2020 will see the start of several. 2021 more will erupt.

RQ13: During my military service GPS was in its infancy; Decca (radio signals from fixed beacons) was commonly used for navigation of aircraft and ships. Why wouldn't this make a comeback when GPS can no longer be relied upon, instead of society simply giving up on the whole idea of global navigation and transportation?

C: It will. Decreased air travel will be ongoing because of fuel costs and availability, after navigation challenges have been solved.

RQ14: *April 5th Update, Dim Period, question #12, large scale extinction of wild animals due to food shortages. TC answers "No, but animals will perish. Extinctions will be few and not material to mankind." Further down a question about survival of trees gives the answer "Overall, vegetation will have reduced photosynthesis and either die or go dormant... " If this reduction of sunlight reduces photosynthesis significantly enough to cause dormancy and/or kill trees and vegetation, will the plankton in the oceans also perish and result in the death of many ocean species? No, not nearly as much. Plankton already receives less sunlight, the reduction reaching it will not be as proportionally significant.*

With the inevitable human food shortages, will hunting and fishing also become a vital necessity?

C: No, however it will become more common.

Possible massive casualties in the animal kingdom break my heart.

C: Your heart need not be broken, casualties on a massive scale are unlikely but will happen. Humans will be casualties, too.

I think we've opened Pandora's Box with all of these questions...thank you for being available to us readers, this must be difficult for you...

A: No and no. Life's difficulties for me, lie far away from this. The Shift will address many of them, very well for me.
