

# Predicting The Future

20 August 2022

*Q: Esteemed Committee, we humans are fascinated with accurate predictions of the future, and we often change our behavior in anticipation, to pursue the positive but avoid the negative. What would human life be if nothing were ever negative?*

C: Positive and negative are subjective. Commonly held, often universal beliefs, about what is good or bad are the effect of social conditioning and function inside the illusion of Earth incarnated life. Human decisions often assume certainty, neutrality and impartiality which in human beliefs are fixed. They are not; these concepts are likewise subjective and decided by common agreement.

When desire for knowledge of the future arises, it is likewise subjective but perceived otherwise thus desired.

*Q: Okay, if somebody desires the winning lottery numbers in advance and then wins, the subjective effect won't change; nearly everybody will take money from such winner, just as they will now, just more people and more money.*

C: An excellent example; the value of money, even the existence of money itself, is a collective agreement.

*Q: You yourselves have often given us accurate predictions of the future but refuse to do so in other cases.*

C: Or we cannot, because a decision has not yet been made. Or taken.

*Q: I am curious, why do some English-speaking countries say "make" a decision, where others say*

*"take"?*

C: Some cultures perceive of themselves as creating their future, others as selecting from options created by others or elsewhere. It is a matter of attitude and approach, the master of circumstance compared to a participant. Building the road or following one already built.

*Q: Why have you and y'all given us some predictions but not others?*

C: To demonstrate collective action, collective power. To demonstrate that some events seem foretold but only because of collective agreement and action. We refrain from other forecasts because the decision remains unmade, or because behavior would be changed to individual and collective detriment.

*Q: But we'd like to know anyway!*

C: Then your detriment will be understood and irreversible.

*Q: Can and do humans truly create our own reality?*

C: Yes. To be specific, humans create human circumstances. Humans do not create the planet, but greatly affect the conditions upon it, much more than humans believe. Generally, humans believe human activity is causing the planet to become warmer. It is a display of collective, condescending arrogance that sometimes amazes us, because it rests upon a foundation of intentionally ignoring what is obvious. How can a planet with the mountains and oceans humans are entirely unable to affect simultaneously possess an atmosphere so fragile that passive human activity is globally destructive to human life? This is an example of what human presence and thought do not create.

The circumstances humans create are temporary effects, human infrastructure. These begin with thoughts, as do all actions.

Events a person encounters are designed around the collective environment any one soul cannot alter, or to occur inside surroundings temporarily created for the one soul and event. This is not so common, because humans wish to interact. Thus, life plan events almost always include human interactions.

Q: *Humans do not create hurricanes, earthquakes, volcanic eruptions or thunderstorms?*

C: No.

Q: *Do humans create surroundings affected by these events?*

C: Yes. You have heard of towns and cities?

Q: *Okay, some events are predictable in that the event and knowledge of it can be shared. Others are known but are prohibited from being shared. Still a third category is an event possible likely or unlikely but not decided.*

C: There is a fourth, the event unforeseen, even by us, from Heaven.

Q: *Why can't we get the schedule or timeline of many events, such as all The Shift stuff?*

C: Because we do not and cannot know where Earth will be in relation to the sun, or which side of Earth will face the central star of your planet group. Time for humans is lap location and step or wheel position. What year, month, week, day or hour will be displayed by human clocks as an event takes place, is irrelevant. All humans will be precisely where they need to be for best benefit and effect to occur to them.

Imagine loosening several wheel lug nuts of a race car to allow small vibration at higher speeds. Can this guarantee the wheel will fall off, or allow the mechanic predict which lap, or location along that lap?

Humans set into motion collective events in just such ways.

Q: *Isn't it better that we humans not know certain things?*

C: Yes, thus you do not know them.

Q: *We feel tricked and deceived if information is later discovered withheld.*

C: This is learned behavior, a trained response. This reaction supplies much experience and learning.

Q: *Don't some humans derive sensations of power and strength from information held back?*

C: Yes, but such humans are exercising control, because they are compensating for sensations of being controlled against their will in another life. The slave turned slave master, one could say. Information is only valuable where assumptions about what humans will do with information, prove accurate.

Q: *What would happen if no information were ever withheld, we could have all things plus all events could be predicted, controlled avoided or joined?*

C: You have already enjoyed a limitless abundance of this, it is called Heaven.

Q: *Why do some predictions prove inaccurate?*

C: Humans change their minds. Sometimes.

*Q: If we had the ability as humans to know most of what will happen for short, medium and long terms or to know very little, which would be better?*

C: False question, since humans DO have the ability to know what will happen by asking around several sources, beginning with their guardian angel guides. That humans actively discourage recognition of guardian angel guide existence or of communication with them, is another topic.

Humans choose to know little then choose to complain about this human choice.

*Q: Any predictions y'all can share now, predictions we'd enjoy or at least benefit from knowing?*

C: Presidential politics in the USA will continue to be chaotic. Price increases or inflation as the effect is labeled, will continue for several more years. Strong candidates for US President will emerge that currently almost no one expects.
