

The Proximate Future

23 December 2022

Q: *Let's start with the next few days. Today's Friday the twenty third of December; a bitterly cold, fast and strong mass of cold air from Siberia, has "Russia-ed" across the USA by way of Canada. (Canada's accustomed to such wind & temperature but The Gulf Coast of the USA, from Houston Texas through New Orleans, Louisiana, Mobile Alabama and Pensacola, Florida are colder than Moscow, Russia at the moment). More than half the USA is far colder than normal. This used to happen once every three decades but now twice in two years. Esteemed Committee, is this the once-in-a-generation aberration or...*

C: This is The Shift. The initial cause is solar energy reaching Earth, followers of scientific news might remember a strong magnetic field disturbance to Earth a little more than a week ago. This rift or break in the magnetosphere allowed upper atmosphere effects which caused shift is high altitude airflows. The result was the movement of the cold air over portions of North America where such temperatures are rarely reached.

Q: *What were the effects? How did this happen?*

C: You have all heard of the australis or aurora borealis, the effects of solar wind upon the upper atmosphere. This recent unusual opening allowed more solar energy to reach the upper atmosphere, causing unusual temperatures for the layers of air involved. Rising air from lower levels temporarily altered wind patterns, allowing the very cold air to move across regions of Earth's surface where this rarely happens.

Q: *Are we going to see the implementation of central bank digitized currency in year 2023? By this I mean money which cannot be converted to cash or given to others by paper cheques.*

C: Yes. Several nations will adopt it, partially. The implementation will not be forced, not at first. The introduction will be deemed voluntary, offered for the efficiency and betterment of the citizenry. The imposition portion will follow after enough volunteers have adopted the system.

Q: *What will be the goal?*

C: Control of behavior.

Q: *What about pandemic type restrictions on movement, travel and personal contact as the result of another virus or something else?*

C: This is not coming in 2023.

Q: *We're now riding the downslope of the first oil shock. Is the next one coming in 2023 or later?*

C: At nearly the end of 2023 crude oil prices will rise again sharply.

Q: *I expect the readership will have more and better questions about the proximate future, so let's have them. Ok folks, here we are.....*

C: Ready we await, also.
