

Zeta Reticulum

21 May 2021

$2 + 1 + 5 + 2 + 2 + 1 = 13$, $1 + 3 =$  What's this four, anyway?

Without an idea for a specific topic, I ask The Committee for their help in bringing forward a visitor to Earth from another planet orbiting another star, to tell us what they're observing and thinking regarding Earth. I prime the pump with a question to get the train rolling.

AE = Visitor to Earth C= The Committee Q = Théorie du Complot Anonyme (just kidding; I'm not "Q")

Q: Esteemed Committee thank you once again for connecting the wires, inserting the plugs. (I'm not a good telephone operator, not even talented enough to be a bad one, which I know from switchboard struggles moons and moons ago.)

What I'd like to ask of any visitor willing, is to describe what they see as important at the moment for humans and Planet Earth.

C: Something humans can easily observe, however a fresh perspective and point-of-view are always beneficial. We have a visitor from Zeta in the Reticulum constellation [sidebar: binary system in the constellation of Reticulum, the pair can be seen with the naked eye as a double star in a very dark sky, meaning no moon and little human light, about 39 light years from Earth]

Q: Dear Zeta visitor, we know from much previously channeled information, our cousins from planets orbiting Sirius, Arcturus, several in the Pleiades cluster and Canopus are our general security oversight. You from Zeta Reticulum are not. Still....you visit often?

AE: Yes, yes and yes we do.

Q: Why three responses, why the word "yes" three times?

AE: Three of us are in attendance.

Q: All the humans will want your names, badge numbers, home addresses and vital measurements. At least your names.

AE: Anyone who wishes may assign us the name we get, and we shall remember that label when encountering that human again.

Q: Y'all have no names really.

AE: Correct, we do not require them.

Q: Please let's fast forward to now; what do you three and your society see as the pressing issue on Earth right now?

AE: The human need to identify pressing issues and rank them.

Q: What could be thought differently?

AE: Consideration can be given to the perceptions of the rankers and the groups of people affected. Press bias in the USA is not a negative thing for China. This matter portrayed as pressing for whom?

Q: What's a pressing issue for readers of this website? I know from one of them, it's among the bazillions & gazillions blocked by the CCP.

AE: For your website readers specifically, the pressing issue is how to divulge what they have picked up here, how to pass along in general what they understand and possess, with a greater proportional benefit for the recipients of the information than personal detriment or damage to your loyal and frequent readers. A positive balance, you would say.

For the populations of the nations where this website is available, the pressing issue is far different but quite distinct, also.

Such nations are struggling with press freedom, bias and open communication.

Q: Not safety or economic problems?

AE: No, which exist but can be solved with better communication. Better economic flows don't solve poor communication. Good economic conditions will come about as the effect of good communication, however.

Q: Why do you visit and observe Earth?

AE: For the same reasons our cousins and colleagues do, to learn.

Q: Can't a rotating shift schedule be assembled to have each visitor group report back findings?

AE: This is already done. Making our own observations and comparing what is told to us with our findings, are of great benefit.

Q: What then is the attraction of visiting Earth and observing her occupants, residents, inhabitants or whatever we are thought to be? You from Zeta are so far advanced by comparison, your travel to Earth is ample evidence and proof of it.

AE: Uniqueness. We observe not just humans, but all life and landscapes, and the physical environment. One example we like is meteorology; we are fascinated with weather on Earth and also other planets in your system, especially Jupiter.

Q: Humans are chomping at the bit to know more about visitors such as yourselves, but I fear our human attitudes and ideas are not the most beneficial.

AE: We are owed no explanation and require no human adjustments. We are revealing our presence more often and frequently, with a lofty goal we are certain we shall achieve, to maintain our ability to impartially observe Earth yet also allow humans to know about us and about information we might offer.

Q: This topic I plan to explore in greater detail and hope we can have more input from Zeta visitors.

AE: We will be most happy to assist when and where we can.

Q: I don't need to say that what viewers will want is a schedule of landings and appearances, handshakes and cocktail parties where we can all mingle and network. Okay, maybe not the social stuff but dates, places and times they can see your ship(s) land, observe occupants emerge and then watch the ship depart. By the third accurate forecast, my life would be upturned forever, and billions would be hanging on the next forecast. If this is not arranged

through me, please can it be arranged through somebody?

AE: Yes to both, however we must consider the other members of the galactic federation, your friends and ours.

Q: A schedule has already been prepared, yes?

AE: Of course.

Q: It is not a fixed plan, with concrete calendar dates and such?

AE: No. Human decisions mean everything to this plan.

Q: General frustration with human leadership isn't sufficiently motivating to bring about mass contact with many of us NGO types? [Non Gubmint Operative]

AE: No, not so much. The challenge for you humans is your decision to organize yourselves in a way where your chosen managers are not responsive to general wishes and preferences. You continue to renew these arrangements and schemes, and respectful we must always be of your decisions.

Our contacts with individual humans, or groups of you, where these are not made outside life contract scheduled events, must balance the two sides of arrangements humans have made.

If humans wish to purge the concealment crews from government, you can do this. We cannot interfere, so our interaction is limited to providing small pieces of information which purge patrols would use to expose then remove concealment crews.

The challenge for us has been and continues to be progress; as we have begun the process, we cannot drop the next few crumbs until we see humans encounter, recognize pick up then beneficially use the hints, clues and nudges we have previously provided.

An example is the crop circle. Many we have made and have also been placed by other civilizations, obviously contain information which serve as significant clues. Typically, humans encounter, analyze then incorrectly explain away what has happened. Insufficient citizens step forward in protest, to complain about the explanation, consider they are being consoled but deceived, not informed well. Humans then do not demand better and quicker information.

This holds us in position a bit, because we cannot offer much additional information until general acceptance is given to the essential previous piece. If we create a bible of visitor information and data, a concise encyclopedia about us, it would overwhelm human scientists, become written off in general and the sad part is, some less than well-meaning humans would seize upon technology to manufacture weapons.

Q: What do you recommend?

AE: You have the idea already. S/he who requires the information will be placed before it and derive the personal benefit they can use, and then if they choose, may add their personal benefit to the group effort in order to spread awareness.

Q: Thank you and do return soon.

AE: Our pleasure, we assure you. Good-bye.
